

# SysCurve PDF Metadata Remover

## Tool - Working Guide

---

### Introduction

SysCurve PDF Metadata Remover is a Windows utility that cleans PDF properties and hidden metadata without uploading files to any server. Use it to remove author names, internal tags, and application details before sharing documents with clients or external teams. The tool writes a new, cleaned PDF and keeps the original file unchanged for safe comparison.

### Key Features

- Clears standard document properties like Title, Author, Subject, Keywords, Creator, and Producer.
- Attempts to remove XMP metadata streams when they are present and readable.
- Optional date cleanup can blank creation and modification fields where supported by the file structure.
- Batch mode processes multiple PDFs in one run and records a clear status per file.
- Drag and drop input with a grid view helps verify file names, sizes, and paths before starting.

- Safe output naming adds a cleaned suffix and avoids overwriting existing files.
- Skips locked or corrupt PDFs and continues the batch with a final summary report.
- All processing stays local on your PC for privacy-first workflows.

## System Requirements

- Operating System: Windows 7, 8, 10, 11
- Processor: Dual-core Intel or equivalent
- RAM: 4 GB minimum, 8 GB recommended for large batches
- Hard Disk Space: 500 MB for installation, plus space for cleaned outputs
- .NET Framework: Version 4.7.2 or higher

## Installation Steps

1. Download the installer from the SysCurve website.
2. Run the setup file and follow the on-screen prompts.
3. Launch the tool from the Start menu or desktop shortcut.

## How to Use

1. Open SysCurve PDF Metadata Remover on your Windows PC.
2. Add PDFs using Add Files or drag and drop into the window.

3. Choose an output folder where cleaned copies should be saved.
4. Click Start to remove metadata and wait for the completion message.
5. Review the summary and the TXT report in the output folder.
